Cardinal Numbers in Modern Standard Arabic Abdullah Alsubhi, 2016 In Modern Standard Arabic, when cardinal numbers are grouped with nouns, they show very complex patterns of syntactic behavior in terms of agreement, position, and case. In this thesis, I propose syntactic explanations for these patterns with several groups of Arabic numerals. In the case of numerals 1-2, I show that they are attributive adjectives, thus showing full agreement with their counted nouns via a feature-copying process. I also illustrate that the numerals 3-10 are quantifiers that can appear in pre- or post-nominal position. In pre-nominal position, following Halle (1993) and Alqarni (2015), I show that they are projected above their DPs. As a result, they bear a case determined by their syntactic position and assign genitive to their complements. This also accounts for the numerals' indefiniteness. However, in their postnominal position, I propose that since these numerals surface as adjuncts to their nouns, they show definiteness and case agreement via a feature-copying process. In both positions, I propose a gender switch rule that deletes the numerals' feminine feature when appearing adjacent to any syntactic category that carries the same feature. In the case of numerals 11-12, I show that they consist of two parts with the first part being a noun and the second an adjective modifying the nouns. Proposing that the first parts are nouns explains why only the first part of the

compound can bear the definite article. It also explains the partial agreement in gender and case between the first and second parts of these compound numerals. For 13-19, I follow Alqarni (2015) in his proposal for their structure. However, I also explain gender polarity between the first part of the compound and the counted noun through the gender switch rule I proposed for 3-10. Numerals 20-90, 100, and 1000 are noun-like numerals, which means they display fixed gender. Since they are nouns, I propose that they acquire their features through raising and are assigned a case determined by their syntactic position. The difference between 20-90 and 100/1000 is that 20-90 assign accusative case to their nouns while 100 and 1000 assign genitive case. Finally, following Alqarni (2015), I consider the two coordinated numerals which give the meaning of 21-29/91-99 of a different noun phrase from which the first is deleted at PF. I divide them into low coordinated numerals (where the first coordinate is 1-2) and high coordinated numerals (where the first coordinate is 3-9). I show that both high and low coordinated numerals behave as if they were used independently.

The Number Sense Stanislas Dehaene, 2011-04-29 Our understanding of how the human brain performs mathematical calculations is far from complete, but in recent years there have been many exciting breakthroughs by scientists all over the world. Now, in *The Number Sense*, Stanislas Dehaene offers a fascinating look at this recent research, in an enlightening exploration of the mathematical mind. Dehaene begins with the eye-opening discovery that animals--including rats, pigeons, raccoons, and chimpanzees--can perform simple mathematical calculations, and that human infants also have a rudimentary number sense. Dehaene suggests that this rudimentary number sense is as basic to the way the brain understands the world as our perception of color or of objects in space, and, like these other abilities, our number sense is wired into the brain. These are but a few of the wealth of fascinating observations contained here. We also discover, for example, that because Chinese names for numbers are so short, Chinese people can remember up to nine or ten digits at a time--English-speaking people can only remember seven. The book also explores the unique abilities of idiot savants and mathematical geniuses, and we meet people whose minute brain lesions render their mathematical ability useless. This new and completely updated edition includes all of the most recent scientific data on how numbers are encoded by single neurons, and which brain areas activate when we perform calculations. Perhaps most important, *The Number Sense* reaches many provocative conclusions that will intrigue anyone interested in learning, mathematics, or the mind. A delight. --Ian Stewart, *New Scientist* Read *The Number Sense* for its rich insights into matters as varying as the cuneiform depiction of numbers, why Jean Piaget's theory of stages in infant learning is wrong, and to discover the brain regions involved in the number sense. --*The New York Times* Book Review Dehaene weaves the latest technical research into a remarkably lucid and engrossing investigation. Even readers normally indifferent to mathematics will find themselves marveling at the wonder of minds making numbers. --
